

PROJECT ATLAS

Plain-English / Non-Technical Functional Requirements Document

A complete, easy-to-understand companion to the supplied Project Atlas requirements digest

Purpose	Help a non-technical reader understand what the marketplace must do, why it matters, and what is included in the first release.
Source	Project Atlas — Delivery Team Pack, including Part 2: Requirements Digest based on FRD v1.1.
Coverage	All requirement areas, settled decisions, open decisions, delivery phases, screen inventory, demo expectations and known discussion points.
Status language	MUST = required. SHOULD = desired. Phase 2 = later. Out of scope = explicitly excluded.

Important

This is a plain-language companion. It simplifies the wording but does not intentionally change the supplied requirements, priorities or decisions. Requirement IDs are retained so you can trace statements back to the source.

How to use this document

The original pack is written for delivery and engineering teams. This version is designed for quick understanding and client-question preparation. Each section explains the business purpose, the required behaviour, and what is later or excluded.

Project in one sentence

Simple explanation

Build a Brazilian online marketplace where many franchise stores can sell automotive parts through one customer-facing website, while the marketplace fairly decides which eligible store gets the main buying opportunity.

The two ideas that make this marketplace different

- **Fair distribution between franchise stores:** the cheapest store does not automatically win. Eligible stores share demand according to their operational score, while a price safeguard prevents a store from being too far above the lowest eligible price.
- **Vehicle fit comes first:** shoppers are expected to search for a part for a specific vehicle, so vehicle compatibility is central to the shopping experience.

What the buyer gets

- Search, product pages, cart, checkout, payment, delivery, orders, questions, reviews and claims/returns.
- One product page even when several stores sell that product.
- A featured store offer plus a collapsed list of other nearby stores.

What the business gets

- Controlled demand distribution between franchise stores.
- A seller performance score.
- Central product information and moderation.
- Visibility into payments, delivery, orders, disputes and seller performance.
- Explainable business decisions.

§1–3 · Project context and boundaries

The marketplace is for a national Brazilian franchise network selling automotive parts to consumers. Each franchise store acts as a seller. Buyers may be registered or guests. The supplied document uses Mercado Livre as the reference for normal marketplace behaviour when the requirements do not say otherwise.

The business flow

Easy mental model

Seller systems → Hub → Marketplace

Seller systems provide operational information. The Hub is the central connection point and source of truth. The marketplace presents that information to customers and sends orders and relevant updates back through the Hub.

Reference	Priority	Plain-English requirement
FR-CTX-001	MUST	The marketplace must not connect directly to individual seller systems. Seller information must pass through the Hub.
FR-CTX-002	MUST	The marketplace must not create a competing authoritative version of seller products, stock or prices.
FR-CTX-003	MUST	The B2C marketplace must not use the existing B2B credit/invoice model. Consumers pay through the payment provider; the Hub does not approve consumer payments.
FR-CTX-004	MUST	Every exchanged business event belongs to one seller, and the marketplace is registered in the Hub as a B2C channel.

Who uses it

- Consumers — registered or guest.
- Seller operators and seller administrators.
- Client catalog moderators, operations/dispute staff and commercial administrators.
- The Hub and seller-side business systems.

Reference	Priority	Plain-English requirement
FR-ROL-001	MUST	People must only see and act on information appropriate to their role, seller and branch.
FR-ROL-002	MUST	One seller must never be able to access another seller's private information or records.

§5 · Catalog and product information

The marketplace starts with a central product catalog owned by the client. Sellers do not freely create duplicate versions of products. Seller information is matched to the central catalog and reviewed when necessary.

Keeping products clean

- Load and update the central catalog in bulk.
- Match incoming seller products to existing products instead of creating duplicates.
- Use identifiers such as EAN/GTIN, manufacturer part number, brand plus part number and normalized description.
- Send uncertain matches to moderation; unmatched products can become new-product candidates.
- Moderators can approve, merge or reject products and provide reasons.
- Seller improvements such as images, dimensions, descriptions, fitment and attributes can enrich a product after review.

Reference	Priority	Plain-English requirement
FR-CAT-001–006	MUST	Maintain the central catalog, match seller products, moderate uncertain/new products, control seller contributions and show accepted/pending/rejected contributions with reasons.
FR-CAT-060	SHOULD	Recognize useful seller contributions through rankings, badges and exports. Recognition must not change score, allocation or commission.
FR-CAT-061	MUST	Moderators need workload measures: waiting items, oldest item, average decision time and decisions per moderator.

Product information

- Product name, descriptions, brand, category, status and ordered images.
- Category-specific attributes, video where available and associated SKUs.
- SKU code, EAN/GTIN, weight, dimensions, variations, packaging and image links.
- Hub references for important business objects.

Reference	Priority	Plain-English requirement
FR-CAT-007/008	MUST	Store the required product and SKU information.
FR-CAT-009	MUST	Keep Hub identifiers and provide the marketplace's own external identifier for listings and orders.
FR-CAT-010–014	MUST	Maintain categories, brands and category rules and provide clear rejection reasons when submitted information is invalid.

§5 + §7 · Vehicle fitment and search

Finding the correct part for the buyer's vehicle is a core part of the experience.

Vehicle compatibility

- A part can fit multiple vehicle definitions.
- Vehicle information includes make, model, year range, engine and trim/version.
- Fitment can be loaded in bulk and maintained by the business.
- Fitment is used in search, filters and product pages.
- Top vehicle groups include cars & pickups, trucks & buses and motorcycles, plus light line, heavy line and agricultural.
- Licence-plate lookup is a later-phase capability.

Reference	Priority	Plain-English requirement
FR-CAT-020–022	MUST	Connect SKUs to the vehicles they fit and use that information across the shopping experience.
FR-CAT-023	SHOULD / Phase 2	Use a future external service to turn a licence plate into a vehicle and show suitable products.
FR-CAT-024	MUST	Use the defined vehicle segments as major navigation choices.

Search experience

- Search product name, brand, part number, EAN, synonyms and fitment.
- Handle normal spelling mistakes and Brazilian Portuguese variations.
- Provide autocomplete.
- Choose vehicle make → model → year → version and keep the selection during the session.
- Filter by category, brand, price, shipping, delivery, vehicle line, own brand and rating.
- Sort by relevance, price, rating or newest; support grid/list views.
- Show one product card rather than one card per seller offer.

Reference	Priority	Plain-English requirement
FR-SRCH-001	MUST	Search must cover key product and vehicle information and tolerate normal spelling/language differences.
FR-SRCH-002/003	MUST / SHOULD	Vehicle-first searching is required; saving multiple vehicles is desired.
FR-SRCH-004/005	MUST	Provide the required filters, sorting choices and result views.
FR-SRCH-006/007	MUST	Only show products that can actually be bought based on stock and serviceable location.
FR-SRCH-008/009	SHOULD	Allow business-controlled ranking and provide search insights.

§5.5 · Product kits / bundles

A kit is sold as one commercial item but contains several individual parts.

Launch rules

- The kit has its own product page, price, images and selling status.
- All components must be available at the same fulfilling branch; no partial kit or substitution.
- The cart shows one kit line. Components are visible but cannot be changed individually.
- The order breaks the kit into individual components with their own quantities and prices while retaining the kit identity.
- The order page shows the kit and its component breakdown.
- At launch, sellers create their own kits from their own SKUs, fulfil them from one branch and pass moderation.
- If a kit cannot be completed, it cannot be sold. If no complete kit is available, the page offers individual components.
- Components hold stock; the kit has no separate stock balance.

Reference	Priority	Plain-English requirement
FR-CAT-040–045	MUST	Support seller-created kits with their own identity, all-or-nothing availability, controlled cart behaviour, itemized orders and moderation.
FR-CAT-046	Phase 2	Later, the client may define standard kits and offer a buyer-facing kit builder.
FR-CAT-047/048	MUST	Do not sell incomplete kits and calculate availability from actual component stock.

Known open question

The requirements say sellers define and price kits, while normal listings and prices come through the Hub. The source explicitly asks: where exactly is a seller kit defined and priced? This needs client clarification.

§6 · Product pages and seller offers

There is one product page per product even if several stores sell it. Each store's offer sits under that shared product.

Product page

- Show one featured store offer selected by the allocation rules.
- Show a collapsed “other stores near you” section, closed by default.
- Never sort alternatives by price. Use proximity first, with seller score as the tie-breaker.
- Show store, distance, score and delivery estimate for alternatives; price is visible but not the ordering axis.
- Let the buyer deliberately choose another store and count that choice in demand-share reporting.
- Show fitment, images, video when available, technical information, description, price, instalments, PIX price, shipping, delivery, stock, seller identity, score, questions and reviews.
- Clearly identify who sold and shipped the item.

Reference	Priority	Plain-English requirement
FR-PDP-001/002	MUST	One shared product page can contain offers from multiple stores.
FR-PDP-003	MUST	Show one featured offer and a collapsed list of nearby alternatives.
FR-PDP-009/010	MUST	Do not turn alternatives into a price-shopping list and record deliberate choices of another store.
FR-PDP-004–008	MUST / SHOULD	Show required product, price, fitment and seller information; video is desired; seller attribution must be clear.

Seller listings

- A seller offer appears only when the Hub publishes it.
- The Hub can create, update, pause, unpublish or remove the offer.
- The marketplace applies quality checks such as image, description, dimensions and category rules.
- All sellers go through moderation, including trusted sellers.
- Marketplace rejection/suppression is communicated back to the Hub.

Reference	Priority	Plain-English requirement
FR-LST-001–004	MUST	Seller offers follow Hub publication instructions and have clear states such as active, paused, under review or rejected.
FR-LST-005	MUST	Apply listing quality rules and provide clear rejection reasons.
FR-LST-006/007	MUST	Moderation applies to every seller and suppression is communicated to the Hub.

§7 · Geographic eligibility and fair demand allocation

When several stores can serve the same buyer, the marketplace does not want demand to go only to the cheapest or closest store. Eligible stores share the opportunity according to operational score, while a price safeguard prevents an offer from being too expensive.

Step 1 — Who can serve the buyer?

- The buyer's postal code identifies the relevant area.
- A store/branch is eligible when its service area covers that buyer.
- The product must be in stock at a branch that can fulfil the order.

Step 2 — What share should each store receive?

Worked example

If three stores have scores of 5, 4 and 3, their target shares are 41.7%, 33.3% and 25.0%.

Step 3 — Apply the price safeguard

- Find the lowest price among eligible stores.
- Only stores within the configured tolerance of that lowest price can compete for the featured position.
- Stores outside the price band remain visible as alternatives but cannot become featured.
- Wide tolerance → score has more influence.
- Narrow tolerance → price has more influence.
- Zero tolerance → cheapest store always wins, and the administrator must be warned.

Reference	Priority	Plain-English requirement
FR-GEO-001/002	MUST	Determine eligible stores from service coverage and actual stock.
FR-GEO-003	MUST	Share featured-offer opportunities according to seller score.
FR-GEO-004	MUST	Balance allocation over time and report actual share against target share.
FR-GEO-005	MUST	Keep the featured store stable during the same session.
FR-GEO-006	MUST	Be able to explain who was eligible, their scores and why the winner won.
FR-GEO-007/008	SHOULD	Provide configurable no-coverage behaviour and minimum-score rules.
FR-GEO-009	MUST	Keep other eligible stores visible.
FR-GEO-010	MUST	Apply the configurable price safeguard before score-based allocation.
FR-GEO-011/012	MUST	Record the price decision and separate demand lost because of price from demand lost because of lower score.

Why it matters

The business wants franchise stores to compete on service quality without creating an open price war on the product page.

§7.3 · Regions and local business rules

A region is a named collection of postal-code ranges. The same geographic concept is used across the marketplace.

- The same region concept supports service areas, allocation, price safeguards, campaigns, synonyms and delivery promises.
- Regions can overlap and are versioned so historical orders can still be tied to the correct region.
- Launch campaigns can target regions for promotional pricing, free shipping, homepage banners or category boosts.
- Regional synonyms use the same region definition.
- Regional content is later; regional assortment is explicitly excluded.

Reference	Priority	Plain-English requirement
FR-RGN-001	MUST	Define regions using named postal-code ranges.
FR-RGN-002	MUST	Use one consistent region model across allocation, shipping, campaigns, synonyms and delivery promises.
FR-RGN-003	MUST	Keep region history so past orders can be tied to the correct version.
FR-RGN-004	MUST	Allow time-limited campaigns targeted to selected regions.
FR-RGN-005	MUST	Allow synonyms to be scoped to regions.
FR-RGN-006	Phase 2 / Out of scope	Regional content is later; regional assortment is excluded.

§8 · Seller performance score

The seller score is a trust and performance measure. It influences demand allocation and may also be shown to buyers.

Measure	Weight	Plain meaning
Late delivery rate	40%	How often the seller is late under the defined rules.
Cancellation rate	30%	How often orders are cancelled under the defined rules.
Mediation rate	30%	How often orders lead to mediation/claims under the defined rules.

Initial grading bands from the source:

Grade	Late rate	Cancellation rate	Mediation rate
5	≤ 5.00%	≤ 2.00%	≤ 1.00%
4	5.01–8.00%	2.01–3.00%	1.01–2.00%
3	8.01–10.00%	3.01–4.00%	2.01–3.00%
2	10.01–15.00%	4.01–5.00%	3.01–4.00%
1	15.01–20.00%	5.01–10.00%	4.01–5.00%
0	≥ 20.01%	≥ 10.01%	≥ 5.01%

Source example: 5.00% late / 2.56% cancellation / 1.03% mediation → grades 5 / 4 / 4 → overall score 4.4.

Reference	Priority	Plain-English requirement
FR-SCR-001–004	MUST	Calculate scores at least daily, allow the rules to be configured, handle insufficient history as configured and keep score history.
FR-SCR-005	MUST	Seller staff can see score, components, grades, distance to next grade and the orders behind the numbers.
FR-SCR-006	SHOULD	Show buyers a simple reputation indicator.
FR-SCR-007	MUST	Buyer- or payment-caused cancellations must not unfairly reduce seller performance.
FR-SCR-008	SHOULD	Alert sellers when performance worsens and operations when a serious floor is breached.
FR-SCR-009–012	MUST	Reuse the score for defined business decisions, but only the three operational rates may determine it; enrichment, volume, tenure and campaign participation do not change it.

§9–10 · Pricing and inventory

§9 · Pricing

Prices come from the Hub. The marketplace does not create its own base-price calculation.

- No price based on an individual customer or company tax identifier.
- Promotional prices arrive from the Hub with a validity period.
- Show price, discount information, PIX price and instalment information.
- Regional differences emerge from seller selection and the price safeguard, not a separate regional price table.
- Placed orders keep their original agreed prices even if prices later change.
- Client-funded exceptional promotions are planned for Phase 2.

Reference	Priority	Plain-English requirement
FR-PRC-001/002	MUST	Use the Hub as the source of seller price and do not create customer-specific pricing.
FR-PRC-003/004	MUST	Handle Hub-provided promotions and display required price information.
FR-PRC-005	OUT OF SCOPE	Do not create different prices for the same part based on vehicle application.
FR-PRC-006/007	MUST / Settled	Regional differences come from seller selection/price safeguard; placed orders keep their original prices.
FR-PRC-008	SHOULD	Make client campaign pricing distinguishable from seller pricing.
FR-PRC-009	Phase 2	Allow exceptional client-funded promotions with seller reimbursement and clear records.

§10 · Inventory / stock

- Stock is tracked by product variant and branch.
- Available stock means physical stock minus stock already reserved.
- The Hub supplies stock; the marketplace must not guess it.
- The Hub may instruct a zero-stock pause; replenishment does not automatically republish.
- Repeated or late stock messages must not overwrite newer information.
- Checkout reserves stock for the payment attempt and releases it if payment fails/expires.
- A future option may show last-unit information.

Reference	Priority	Plain-English requirement
FR-INV-001/002	MUST	Use actual stock by product and branch, based on on-hand minus reserved quantities.
FR-INV-003	MUST	Respect Hub pause instructions and do not automatically republish after replenishment.
FR-INV-004	MUST	Never allow an older stock update to overwrite a newer one.
FR-INV-005	MUST	Reserve stock during payment so two buyers cannot buy the same final unit.
FR-INV-006	SHOULD	Provide configurable last-unit messaging.

§11 · Cart, checkout and payment

Cart and checkout

A buyer may purchase from several stores in one shopping experience. Each store's part of the purchase is handled separately.

- Cart groups items by seller.
- Each seller group has its own shipping and delivery estimate.
- Checkout creates one order per seller while the buyer experiences one purchase.
- Logged-in carts persist across devices; guest carts persist for the browser session.
- Price, stock and eligibility are checked again before payment.

Reference	Priority	Plain-English requirement
FR-CRT-001–004	MUST	Support multi-seller shopping while keeping each seller's fulfilment separate and rechecking important information before payment.

Customer identity

- Registered checkout uses CPF and email; password recovery is required.
- Guest checkout captures CPF, name and contact information.
- Social login is desired.
- Multiple saved addresses with postal-code autofill and separate delivery/billing addresses are required.
- Checkout shows totals by seller group and any client-funded discount.
- Clear totals and required Brazilian consumer information must be shown before payment.

Reference	Priority	Plain-English requirement
FR-CHK-001–005	MUST / SHOULD	Support registered and guest buyers, addresses, seller-group totals and required consumer information; social login is desired.

Payment

- Use a payment provider for credit card, PIX and boleto.
- Do not store raw card details.
- Record payment results and send relevant transaction information to the Hub.
- Reflect refunds, partial refunds and chargebacks.
- The seller is the merchant of record and pays the client a commission.
- Where immediate splitting is supported, the commission is retained and the seller's remainder is released.
- For non-split methods, money is received centrally and later reconciled.
- Seller and finance teams need matching settlement reports and clear states.

Reference	Priority	Plain-English requirement
FR-PAY-001–005	MUST	Support agreed payment methods, protect card information, record status and handle refunds/chargebacks.
FR-PAY-006	MUST	Calculate and record the client's commission while keeping the seller as merchant of record.
FR-PAY-007/008	MUST	Split supported payments immediately and reconcile non-split methods.
FR-PAY-009–011	MUST	Provide reconciliation reports, per-order settlement status and transaction history.

§12 · Shipping and delivery

Shipping is calculated for the buyer's postal code and for each seller group.

- Show shipping cost, carrier/method and estimated delivery time.
- Consider origin branch, destination, weight, dimensions and declared value.
- Support Correios and a configurable carrier table.
- Support free-shipping rules based on value, region or campaign.
- Fast local promises such as “arrives today” / “within 24 hours” are desired.
- Click & collect is desired.
- The order carries shipping information into the Hub.
- Seller staff can print labels/return vouchers and enter tracking.
- Buyers can see tracking and delivery status.

Reference	Priority	Plain-English requirement
FR-SHP-001/002	MUST	Quote shipping at postal-code level for each seller group using origin, destination and item characteristics.
FR-SHP-003	MUST	Support Correios, configurable carrier rules and free-shipping rules.
FR-SHP-004/005	SHOULD	Support fast local-delivery promises and click & collect as desired capabilities.
FR-SHP-006–008	MUST	Carry shipping information into the order, support labels/return vouchers and provide tracking.

§13 · Orders, fulfilment and seller experience

After an order is sent to the Hub, the Hub and seller systems own actual fulfilment. The marketplace owns the buyer-facing order experience.

Orders

- Order includes seller, branch, items, quantities, agreed prices, addresses, shipping, payment, commission and buyer information.
- Retrying an order request must never create a duplicate order.
- Keep the Hub's order reference.
- Reflect preparation, seller-system handoff, invoicing, shipping, delivery, cancellation and return status.
- Check with the Hub before allowing a marketplace cancellation.

Reference	Priority	Plain-English requirement
FR-ORD-001	MUST	Send a complete order to the Hub.
FR-ORD-002/003	MUST	Prevent duplicate orders on retries and retain the Hub order reference.
FR-ORD-004/005	MUST	Reflect Hub status and ask the Hub before marketplace cancellation.
FR-ORD-006/007	MUST	Provide invoice access and a complete order timeline with timestamps and responsibility.

Seller panel

- Sales list with filters, search, bulk actions and export.
- Order detail with fulfilment checklist.
- Invoice upload and label/return-voucher printing.
- Dispute queue with deadline, messages, evidence and history.
- Read-only catalog/stock/price views when the Hub owns the data.
- Performance dashboard and buyer-question inbox.
- One login for multiple branches with branch-specific access.
- A seller-facing API is desired, while catalog/stock/price still come through the Hub.

Reference	Priority	Plain-English requirement
FR-SEL-001–005	MUST	Provide seller sales, fulfilment, documents and dispute tools.
FR-SEL-006	MUST	Do not provide seller editing controls for Hub-owned information.
FR-SEL-007/008	MUST	Provide performance and buyer-question management.
FR-SEL-009	SHOULD	Offer an API equivalent for sellers with their own IT/integrators.
FR-SEL-010	MUST	Support multiple branches under one seller login with appropriate access.

§14 · Questions, reviews, disputes and returns

Questions and conversations

- Buyers can ask product questions.
- Sellers answer; publication follows moderation.
- The Hub is informed when seller-side action is needed.
- Buyer and seller can communicate about an order.

Reference	Priority	Plain-English requirement
FR-MSG-001–003	MUST	Support moderated product questions and order-related buyer/seller communication.

Reviews

- Product reviews come only from verified purchases.
- Reviews are moderated.
- Seller ratings from delivered orders are separate from the operational seller score.

Reference	Priority	Plain-English requirement
FR-MSG-004/005	MUST	Keep reviews tied to real purchases and keep buyer ratings distinct from operational performance.

Claims and returns

- Buyers can claim not received, wrong/different item or defective item and provide evidence.
- Claims can escalate to client mediation when deadlines are missed.
- Client arbitration can decide refund, partial refund, return or rejection.
- Returns are connected to return shipping and visible to relevant parties.
- Automatic escalation timers are desired.

Reference	Priority	Plain-English requirement
FR-DSP-001–004	MUST	Support buyer claims, evidence, escalation, client decisions and visible return status.
FR-DSP-005	SHOULD	Allow configurable deadlines and automatic escalation.

§15 · The Hub relationship — plain English

The Hub is the client's existing central connection layer. It tells the marketplace about seller information and business changes; the marketplace sends new orders and relevant buyer/payment/listing events back.

Coming from the Hub

- Seller setup and activation/deactivation.
- Products/catalog information.
- Stock information.
- Prices and time-limited special prices.
- Seller listing/publication status.
- Order status changes.

Going to the Hub

- New orders.
- Payment updates.
- Listing moderation/suppression status.
- Buyer questions requiring seller-side action.

What reliable communication means

- **No duplicate actions:** the same message twice must not create a second order or repeated business action.
- **Safe retries:** the Hub may retry a message and the marketplace must handle that safely.
- **Seller separation:** every action belongs to the correct seller.
- **Clear failures:** rejected actions return a stable reason.
- **Visibility:** the client can see events, failures, retry state and replay when appropriate.
- **Health:** both sides can show whether the connection is working.

Reference	Priority	Plain-English requirement
FR-INT-001-010	MUST	Provide seller setup, health, product/stock/price updates, listing lifecycle, order handling, relevant notifications, taxonomy access and clear rejection reasons.
FR-INT-011-013	MUST	Use secure platform/seller credentials, keep actions tied to one seller and make incoming operations safe to retry.
FR-INT-014	MUST	Provide per-seller visibility into events, failures, retries and replay.

Readiness checklist

Before integration is ready, demonstrate seller setup, health checks, reliable product/stock/price updates, listing lifecycle, taxonomy access, clear rejection reasons, complete order submission, buyer-facing order/invoice/shipping updates, and no direct seller-ERP access.

§16 · Settled business decisions

These are already decided in the source and should not be treated as open choices.

Topic	Decision	Plain-English outcome
16.1	Vehicle-application pricing	Not supported. Regional differences come from seller selection and the price safeguard; no separate regional price table.
16.2	Featured offer	One featured offer plus collapsed nearby stores; nearby stores are never price-sorted.
16.3	Seller score reuse	The score can be reused for defined business decisions. Visibility consequences can reduce priority; client-funded benefits have separate exclusion rules.
16.4	Seller remuneration	Model B: the franchise store sells at its own price and pays the client a commission. The seller is merchant of record. Model A is not built.
16.5	Regionalisation	One region concept. Regional campaigns launch; regional content is later; regional assortment is excluded.
16.6	Kits	Seller-created kits at launch. Client-created standard kits and a buyer kit builder are later.
16.7	Enrichment recognition	Recognition is non-financial and must not change seller score, allocation or commission.

§16.8 · Two open items

Reference	Priority	Plain-English requirement
Open item 1	OPEN	Which payment provider will be selected, and which payment methods can support immediate splitting in Brazil?
Open item 2	OPEN	What exact price tolerance should be used for the price safeguard? This is a client configuration decision and is not required before building the simulator.

§17 · Launch, Phase 2 and out of scope

Phase 1 — MVP / launch

- Central catalog, matching and moderation.
- Categories, brands and category rules.
- Vehicle fitment and vehicle-first search.
- One product page with multiple store offers and collapsed alternatives.
- Eligibility, price safeguard and score-based allocation.
- Regions and regional campaigns.
- Seller score and reusable score input.
- Search filters and sorting.
- Seller-created kits.
- Cart and checkout including CPF and guest checkout.
- Card, PIX and boleto payments with commission handling.
- Payment splitting where supported plus reconciliation and settlement states.
- Shipping quotes, labels and tracking.
- Hub-connected order lifecycle.
- Invoice upload/download.
- Full seller panel including transactions and settlement.
- Client back-office for moderation, sellers, regions, allocation/price audit and administration.
- Buyer account, contribution tracking and recognition.

Phase 2

- Licence-plate search.
- Saved vehicle garage.
- Click & collect.
- Client-created kits and buyer kit builder.
- Client-subsidised promotional pricing.
- Regional content.
- Advanced search ranking controls and search analytics.
- Photo/video reviews.
- Advanced dispute automation and deadline handling.

Explicitly out of scope

- Vehicle-application pricing.
- Regional assortment.
- Model A remuneration.
- Consumer CRM/segmentation.
- Advanced return-management capabilities beyond the defined flow.
- Hub-side logistics engine.

- Generic ticketing.
- Direct seller-ERP connections.
- General financial system beyond defined payment/settlement features.

§18 · Expected screens / user-facing areas

The source defines the expected screen inventory. The same inventory is listed here in simpler language.

Customer storefront

- Home with campaign areas
- Vehicle selector
- Search results with filters
- Product page with offers, fitment, gallery, video, questions and reviews
- Seller/store page
- Cart
- Checkout: identification, address, shipping, payment and review
- Order confirmation
- Buyer account: profile, addresses, vehicles, orders/tracking, invoice, returns, claims, questions and reviews

Seller area

- Login and seller/branch switcher
- Dashboard with score and sales
- Sales list/detail
- Fulfilment actions
- Invoice upload
- Label and return-voucher printing
- Tracking entry
- Disputes
- Questions inbox
- Read-only catalog/stock/price views with status/rejection reasons
- Performance and score detail
- Transactions and settlement
- Branches and users
- Integration status

Client administration

- Seller management and setup
- Catalog moderation queue
- Listing moderation
- Category tree and category-specific attributes
- Brand registry
- Synonym dictionary
- Service areas, postal ranges and regions
- Allocation and price-safeguard audit
- Score configuration

- Commission configuration
- Campaigns and homepage controls
- Dispute arbitration
- Integration event/failure/replay view
- Reports

Known discussion points

The source says these should be raised early rather than discovered later.

Topic	Plain-English explanation
Kits vs Hub ownership	The launch requirement says sellers define and price kits, while normal listings/prices come through the Hub. The exact ownership boundary needs agreement.
Allocation over time	The allocation must balance demand over time, not simply make an independent random decision on every visit. The source calls for a prototype early to validate behaviour at scale.
Product matching thresholds	Real seller feeds may create a large moderation workload. Matching rules should be calibrated against real seller data.
Payment splitting	The chosen payment provider must confirm which payment methods can split money immediately in Brazil.

Allocation simulator — what your demo represents

The team pack separately defines a short, time-boxed simulator for the allocation engine. It demonstrates the most distinctive business rule; it is not the full marketplace.

The simulator should show

- Three seeded stores with scores 5, 4 and 3 → target shares 41.7%, 33.3% and 25%.
- A live price-tolerance control showing wide vs narrow tolerance.
- Zero tolerance where the cheapest store always wins, with the required warning.
- A simulated purchase stream showing actual share moving toward target.
- A stable featured store during the same session.
- A decision audit showing eligibility, scores, lowest price, tolerance, exclusions and winner reason.
- A fully offline demo setup and a private URL

Simple demo explanation

“We are demonstrating how the marketplace balances franchise demand. A store must first be able to serve the customer and be within the allowed price range. Among those stores, stronger operational performance gives a larger share of the buying opportunity. The decision is recorded so it can be explained.”

Team preparation and Demo Day

QA demonstration

- A ten-minute live run of a real regression test suite.
- Many flows execute and one deliberately fails so the audience sees the failure.
- Use an internal or demo application only.
- Be ready to explain what you would do if 20 pull requests were waiting for one QA: triage, automation, tools and backlog reduction.

Requirements mastery

- Know the section numbers and requirement IDs.
- Bring two or three genuine observations/questions to the dry run.
- Know the Hub section particularly well.
- Be ready for the seller-created kit ownership/pricing question.
- Know the expected screen inventory.

Communication

- Speak slowly and clearly.
- Use short sentences and avoid idioms.
- Pause after important points.
- Be comfortable explaining your background, stack and recent work.
- Senior Developer drives simulator; Senior QA drives QA demo; Sawan drives the rest.

Materials and room readiness

- One-page profiles for the Senior Developer and Senior QA, plus one alternate each.
- One-page simulator explanation with mapped requirements and private URL.
- Demo machine plus backup laptop, both offline-capable.
- Display/projector/cables tested with the actual machines.

Plain-English questions you should be ready to answer

These are derived from the requirements and preparation instructions. The answers are intentionally short for speaking practice.

What is the marketplace trying to solve?

It creates one consumer marketplace for many franchise stores while controlling product data, seller performance, payments, delivery and how demand is shared.

Why does the cheapest store not always win?

Because the business does not want an open price war between franchisees. Eligible stores share demand according to performance, while the price safeguard prevents offers from being too far above the lowest eligible price.

How is the featured store selected?

First, the store must be able to serve the buyer and have stock. The price safeguard removes offers that are too expensive. The remaining eligible stores share the opportunity according to their scores.

Why is allocation balanced over time?

The marketplace needs actual demand to track the intended shares. An independent random choice on every visit could produce unstable results.

Why does the same store remain after reload?

The requirement says the featured store should remain stable during the same buyer session.

What is the seller score?

A performance score based on late deliveries, cancellations and mediation/claim rates over a rolling 30-day period, weighted 40%, 30% and 30%.

Can catalog contributions improve the seller's allocation score?

No. The source explicitly separates catalog recognition from operational performance. Enrichment must not affect score, allocation or commission.

What happens when a seller's price is outside the allowed range?

It can remain visible as an alternative, but it cannot become the featured offer for that decision. The reason must be recorded.

Why is the other-store list not sorted by price?

Because that would encourage direct price competition and bypass the allocation policy. The list is ordered by proximity, with score as the tie-breaker.

Why is vehicle fitment so important?

Automotive buyers often search for a part for a specific vehicle, so compatibility is central to finding the correct product.

Why is the Hub the source of truth?

The client already has a central connection layer for seller operations. Using it avoids direct connections to many seller systems and prevents conflicting information.

What is the open kit question?

The requirements say sellers create and price kits, but normal listings and prices come through the Hub. The client still needs to clarify exactly where a seller kit is defined and priced.

Who owns fulfilment after the order reaches the Hub?

The Hub and seller systems own actual fulfilment. The marketplace owns the buyer-facing order experience.

How do we avoid duplicate orders?

The order process must be safe to retry. Receiving the same request again must not create a second order.

What happens if stock changes during checkout?

The marketplace checks stock again before payment and reserves the required stock for the payment attempt. If payment fails or expires, the reservation is released.

Who is the merchant of record?

Under the settled Model B decision, the franchise store is the merchant of record. It sells at its own price and pays the client a commission.

What payment decision is still open?

The payment provider has not been finalized, and the team needs confirmation of which methods support immediate splitting in Brazil.

What is Phase 2?

Examples include licence-plate search, saved vehicle garage, click and collect, client-created kits, subsidized promotions, regional content and advanced search/review/dispute features.

What is explicitly out of scope?

Vehicle-specific pricing, regional assortment, Model A remuneration, consumer CRM/segmentation, advanced RMA, a Hub-side logistics engine, generic ticketing, direct ERP connections and a general financial system beyond defined settlement features.

One-page mental model / quick revision

Remember this flow

1. Customer chooses a vehicle → 2. Searches for a compatible part → 3. Marketplace finds stores that can serve the postal code and have stock → 4. Price safeguard removes offers that are too expensive → 5. Seller score shares the featured opportunity → 6. Buyer sees one product page with one featured store and alternatives → 7. Cart groups items by seller → 8. Checkout rechecks price/stock → 9. Payment is taken by the payment provider → 10. Orders go through the Hub → 11. Seller fulfils → 12. Buyer sees status, invoice and tracking and can raise claims/reviews/questions.

Five things to remember

- **Fair demand distribution:** score-based sharing with a price safeguard.
- **Vehicle-first shopping:** fitment is a primary part of the experience.
- **One product, many stores:** one shared page with featured offer and nearby alternatives.
- **Hub-centered operations:** seller product, stock, price and order information flows through the Hub.
- **Explainability:** important decisions and order history must be understandable and auditable.

Status legend

MUST	Required for MVP / launch.
SHOULD	Desired; may move if necessary.
Phase 2	Deliberately planned for later.
Out of scope	Explicitly excluded; do not invent a workaround.
Open	Business decision still needs confirmation.

Source fidelity note

This guide is a plain-language rewrite of the supplied Project Atlas Delivery Team Pack / Part 2 requirements digest. It intentionally simplifies terminology while retaining the source's requirement coverage, priorities, settled decisions, open items, Phase 2 items and exclusions.
